#### **ABSTRACT**

We report the extraction of a bed bug mitogenome from high-throughput sequencing projects originally focused on the nuclear genome of *Cimex lectularius*. The assembled mitogenome has a similar AT nucleotide composition bias found in other insects. Phylogenetic analysis of all protein-coding genes indicates that *C. lectularius* is clearly a member of a paraphyletic Cimicomorpha clade within the Order Hemiptera.

#### **ARTICLE HISTORY**

Received 26 February 2016 Accepted 17 March 2016

#### **KEYWORDS**

Arthropods; blood feeding; Hemiptera; pest; true bugs

The common bed bug, Cimex lectularius Linnaeus, 1758 (Hemiptera: Cimicidae), has been intimately associated with humans for thousands of years (Panagiotakopulu & Buckland 1999; Booth et al. 2015). It is an obligate ectoparasite that primarily feeds on human blood in a haematophagic lifestyle, but will readily feed on many bird and mammalian species as well (Usinger 1966). The insecticide-susceptible laboratory strain Har-73 (= Harlan) of C. lectularius was used for wholegenome shotgun sequencing and sequence assembly de novo, performed by two independent research groups: one in New York City, based primarily at the American Museum of Natural History (AMNH) and Weill Cornell Medicine (WCM) (Rosenfeld et al. 2016), and another one at Baylor College of Medicine (BCM) as part of the i5k genome-sequencing initiative (http://www.arthropodgenomes.org/wiki/i5K) (Benoit et al. 2016). Specimens are kept in the AMNH Invertebrate Zoology collection and stored in liquid nitrogen in the Ambrose Monell Cryo Collection (AMCC). Living colonies are maintained by L. N. Sorkin and fed on human blood and an inbred line is maintained by C. Schal and fed on rabbit blood. Purified DNA and RNA samples are also stored in the AMCC and at WCM. Sequence data for the original genome projects can be accessed on GenBank/EMBL/DDBJ under **BioProject** PRJNA259363 and PRJNA167477. In order to identify orthologous loci and assemble the bed bug mitogenome, we first

queried complete mitogenome sequences from related spe-Adelphocoris fasciaticollis (GenBank accession no. NC\_023796), Empoasca vitis (NC\_024838), Orius sauteri (NC\_ 024583), Peirates arcuatus (NC 024264) and Triatoma dimidiata (NC\_002609) against the genome assemblies of both genome projects. This did not yield significant hits; therefore, we subsequently queried the abovementioned mitogenome sequences against the high-quality Illumina reads (Illumina Inc., San Diego, CA), which yielded bona fide matches. The mitogenome assembly was annotated using MITOS (Bernt et al. 2013), resulting in 13 protein-coding genes, two rRNA loci and 21 tRNA loci (tRNA-Leu was missing), and a mitogenome size of 15,217 bp. The mitogenome sequence is deposited in GenBank under accession code KU350871. We compared our mitogenome sequence to a subset of related mitogenome sequences (Li et al. 2011) in a maximum likelihood phylogenetic analysis using the 13 encoded proteins in RAxML 8.2.4 (Stamatakis 2014) with the MtArt replacement matrix (Abascal et al. 2007) and empirical residue frequencies, along with among-site rate heterogeneity modeled with the  $\Gamma$  distribution and four discrete rate categories (Yang 1994), through 10 searches starting from random-addition maximum parsimony trees (Figure 1(A)). Cimex lectularius was placed as sister to Orius niger and Lygus lineolaris within the Cimicomorpha clade. This is in agreement with a larger phylogenetic analysis

Figure 1. (A) Phylogenetic relationships among Hemiptera species based on the translated sequences of 13 protein-coding genes. Values at the internode branches denote support drawn from 500 rapid bootstrap pseudoreplicates (Stamatakis et al. 2008) mapped onto the best-known maximum likelihood phylogram (—In Lik =63126.175, α = 0.53). Infraorder groupings are indicated. GenBank accessions used: *Acyrthosiphon pisum* (NC\_011594), *Bemicia tabaci* (NC\_006279), *Geocoris pallidipennis* (NC\_012424), *Homalodisca vitripennis* (NC\_006899), *Hydrometra greeni* (NC\_012842), *Laccotrephes robustus* (NC\_012817), *Lygus lineolaris* (NC\_021975), *Macroscytus gibbulus* (NC\_012457), *Ochterus marginatus* (NC\_12820), *Orius niger* (NC\_12429), *Saldula arsenjevi* (NC\_012463), *Triatoma dimidiata* (NC\_002609). (B) Nucleotide composition for each codon position and all tRNA loci.

of hemipteran mitochondrial genomes that displayed a comparable lack of branch support for the backbone of the phylogenetic tree (Song et al. 2012). In terms of nucleotide composition, the *C. lectularius* mitogenome was slightly purine-rich (52%) with a high AT content (71%). Compositional bias was pronounced (Figure 1(B)), as is common in insects (Cameron 2014) with high AT bias across tRNA loci and third codon positions – a characteristic also shared by other Hemiptera (Liu & Liang 2013). This sequence will serve as a resource for evolutionary and comparative genomics studies of true bugs and other animals, as well as the basis of microevolutionary studies of bed bug colonization, infestation, and heteroplasmy (Robison et al. 2015).

## **Disclosure statement**

The authors report that they have no conflicts of interests.

### **Funding information**

The AMNH team thanks the Sackler Institute for Comparative Genomics, the Korein Foundation and The Lewis and Dorothy B. Cullman Molecular Systematics Program at the AMNH for supportingthis project. C. E. Mason would to like to thank the Alfred P. Sloan Foundation (Grant no. 2015-13964), the Bert L. and N. Kuggie Vallee Foundation, the Irma T. Hirschl and Monique Weill-Caulier Charitable Trusts, the WorldQuant Foundation, the STARR Consortium (Grant no. 19-A9-071) and support from the National Institutes of Health (NIH) (Grant no. R25EB020393 and the Ruth L. Kirschstein National Research Service Award). D. Reeves was supported by NIH Grant no. F31GM111053. The BCM team acknowledges funding for

genome sequencing, assembly and automated annotation from the National Human Genome Research Institute (Grant no. U54 HG003273 to Richard A. Gibbs). W. Booth was supported by the Oklahoma Center for the advancement of Science and Technology (Grant no. HR13-211).
